The Spectronic MTM
PC Synchronization Software Module

The Spectronic MTM PC Synchronization Software is developed for Personal Computers with Windows operating system. The software is used for synchronization of the mobile multimedia terminal with a PC as well as keeping a comprehensive history of files in a backup library.

The PC-side user interface shows a graphical representation of two mobile multimedia terminals. One image represents the mobile multi media terminal as a clone. The clone and terminal are fully synchronized whenever the terminal is connected to the PC. This ensures an up to date backup of the information stored in the mobile unit.

The second terminal image keeps a backup of all files in the mobile terminal. When files are deleted from the mobile unit they are kept safe in this second terminal image in the PC. This terminal image holds a total history of files. Files are deleted only when the user manually choose to do so.

The user can navigate through the lists of the two terminals shown on the PC screen just as at the actual mobile unit. Files can be copied, created and deleted as the user decides. Files are automatically opened in the proper PC appication. New addresses can be easily created and transferred to the mobile unit.

A valuable feature of this software is the automatic synchronization with Microsoft Outlook which updates information concering addresses and contacts between the to units.
The system assumes that the user connect the mobile unit to the PC at least a few times a year. A complete backup history will be maintained by doing so.
